Rulings belong inside the ledger app

Research report · Online poker rules advice for amateur players, what drives their questions, and the build decision · 13 October 2026

Amateur poker players get rules advice almost entirely from general-purpose peer forums and a handful of orphaned documents, not from any product built for it. r/poker (about **360,000 members**), PokerChipForum (**17,739 members, 2.9 million messages**) and Quora absorb the questions; the one purpose-built venue, the Poker TDA forum, has **2,032 members** and a tournament remit; the only cash-game reference text, Robert's Rules of Poker, has been **frozen since its author died in May 2022**; and the single "ask a ruling" app is an iPad tool for tournament floor staff that answers from a superseded rulebook and shows no ratings. Interest splits into two kinds of question: high-volume beginner lookups (who wins, kickers, blinds — one Stack Exchange question has **200,299 views**, and "poker rules" draws roughly **165,000 searches a month**) and lower-volume, high-argument judgement calls (a winning hand that touched the muck, verbal versus chips, slow rolls, exposed cards, string bets), where a single "was this right?" post on r/poker routinely draws **100–286 comments**. Home cash games add a third layer the rulebooks never touch — short banks, unrecorded rebuys, rebuy caps, going south, leaving early, IOUs — which hosts settle by procedure and host fiat. The evidence points to **adding a rules and ruling feature to the ledger app rather than building a separate product**: no standalone rules app has an audience (0–22 ratings across the whole category), the only demonstrated willingness to pay is for running the night, and the ledger already holds the three inputs a ruling needs — the players, the stakes and the host — plus the end-of-night money record where most home-game disputes actually happen. To be differentiated it must be cash-game and house-rule aware, cite the rule and the reasoning, work offline at a kitchen table, and leave a timestamped ruling in the night's record.

Rules questions land in general forums, not anywhere built for rulings

The venues amateurs actually use are peer communities where rules questions compete with strategy, session reports and promotion. r/poker is tracked at 360,000 members, up about 40,000 (12.5%) in a year, and "Home Game" is a top-ten topic keyword there, but its common flairs are Discussion, Hand Analysis, Help and Promo — there is no rules flair (GummySearch). Since March 2025 a moderator partnership has pinned GGPoker promotional threads, which tells you how the largest amateur venue is monetised (PokerListings). CardsChat now redirects to a casino-affiliate domain and has **no rules board and no home-games board** at all (CardsChat on casino.us). PokerChipForum is the closest thing to a home-game rules community: 143,100 threads and daily traffic on its "Home Game General" and "Tournaments and Cash Games" boards (PokerChipForum), plus a login-walled "Poker Rules and

Rulings" subforum (PokerChipForum). A representative PCF ruling thread — a single oversized chip thrown in without "raise" in a self-dealt 1-2-5 PLO game — drew 20 replies in one day, nearly all citing Robert's Rules v11 or the TDA rules, and **nobody mentioned an app or website for settling it** (PokerChipForum).

The only forum built for rulings is small and institutional. The Poker TDA forum holds 13,929 posts across 1,687 topics from 2,032 members; its general rules board has 9,649 posts, and a dedicated **"Live Cash Game Rules" board carries 936 posts in 114 topics, with activity as recent as September 2026** — about 10% of the forum's question traffic, on a body that publishes no cash rules at all (Poker TDA forum). The more telling signal is that amateurs route around the forum to a person: Matt Savage, the WPT director and TDA co-founder, says he receives ruling questions on X "in the neighbourhood of 25–30 a day" in summer and 5–10 otherwise, and that the single most-asked question is the one-chip rule (PokerStrategy; the interview is undated and older than the page's 2026 update). One director on Twitter fields more rulings a day than the whole TDA rules board receives in a typical month.

The rulebooks they cite are either frozen or tournament-only

Every forum answer rests on two documents with opposite fates. Bob Ciaffone, author of Robert's Rules of Poker, died on 13 May 2022 (PokerNews); his site had already been taken down, and hobbyists now point each other to Wayback snapshots from before 2020 (PokerChipForum). Version 11 for cardrooms and a separate **62-page private-game edition** survive as PDFs on pagat.com, and the private-game edition's copyright notice bars commercial use without Ciaffone's specific consent — a constraint on any product that wants to bundle it (Robert's Rules, private-game edition). The Poker TDA rules, by contrast, are maintained on a two-year cycle, with the 2026 edition current, but the rules page never mentions cash games and directs all interpretation questions to the forum (pokertda.com). Worse, the copy of the TDA rules that HomePokerTourney — the home-game reference site Google and forum posters point hosts to — distributes is the **2013 edition**, six revisions behind, on a site whose creator died in 2017 and whose pages still read "Copyright © 2017" (HomePokerTourney). Hosts' own practice is "Robert's for cash games and TDA for tournaments" (PokerChipForum), and nearly every published house-rules template ends with "host is the floor; Robert's Rules otherwise" (HomePokerTourney house rules).

The media layer adds nothing adjudicative. Card Player's reader-question column "The Rules Guy" has no dated entries found after January 2017 (Card Player archive). PokerNews' rules hub, last updated April 2026, is a beginner guide to variants and hand rankings with no coverage of string bets, misdeals, showdown order or side pots and no Q&A (PokerNews); Upswing's rules page is the same shape (Upswing). YouTube carries disputes as entertainment — the EPT Monaco 2025 angle, WSOP floor arguments (YouTube) — not as instruction, and since March 2025 the platform auto-rates all poker videos 18+, which creators call a headwind (Sigma World). No paid or subscription rulings service for amateurs was found anywhere; every venue is free and funded by ads, affiliates, sponsorship or volunteer association.

General chatbots fail on exactly the procedural parts

The "ask an AI" route exists but is unreliable where it matters. Nate Silver's May 2025 test of OpenAI's o3 and Deep Research on simulated hands found the models **miscounted the pot and stacks, double-counted a straddle, misapplied the best-five-cards rule and awarded pots to the wrong players** (Silver Bulletin) — pot size, straddles and hand reading being precisely the categories that cause home-game disputes. The institutional answer is Poker TD Assistant, a free iPad app from the World Poker Federation with the TDA that answers plain-language questions against the TDA 2024 rules, keeps a ruling history, and warns that "critical rulings should be verified against the official rulebook"; it has no displayed ratings and still cites 2024 rules after the 2026 edition shipped (App Store). Outside poker, the board-game referee bots that reviewers reward differentiate on citing the exact rulebook page and asking for a missing fact rather than guessing (Ludus Judge AI on Product Hunt).

Mucked hands and verbal bets generate argument; hand rankings generate lookups

Demand has two shapes, and they live in different places. On r/poker the rules stream is a steady minority — measured at roughly **7 "ruling" posts and 6 "mucked" posts a month in 2025–26** — whose typical post scores low (median 2–5 points) but whose comment counts are high (median 13–21), so a rules post reliably starts an argument rather than earning applause (Arctic Shift r/poker archive). The most-engaged situations are all first-person "was this right?" posts with the stakes in the title: a dealer mucking a hand after a verbal all-in (180 points, 141 comments — r/poker); QQ mucked for want of a card protector (65 / 160 — r/poker); "how binding is verbal?" (136 / 44 — r/poker); an out-of-turn etiquette dispute, "was I in the wrong?", at **314 points and 286 comments**, the highest comment count of any rules thread sampled (r/poker); slow-roll disputes at 120 / 140 and 126 / 122 (r/poker; r/poker); an incorrect floor ruling on a $4,600 hand (130 / 90 — r/poker); and a player tabling three cards, "pocket 997", at 381 / 91 (r/poker). Strategy and session posts in the same samples score far higher — one pro's first live day drew 1,593 points (r/poker) — which confirms that rules content is a minority of the subreddit but a disproportionate share of its arguments.

The professional venue ranks the same way. On the TDA forum's general board, "accidental muck" has 23,186 views and "is my hand dead?" 20,060, while the most-replied thread of all is "Standardization of rules — a pipe dream?" at 37,366 views, the community's own admission that rulings are unsettled (Poker TDA forum, sorted by views). The cash-game board's top threads are a direct, if small-sample, ranking of what cardroom staff find hard in cash play: **"Dealer error: do we force player to pay?" 61,367 views, "Running it twice" 58,513, forward motion and straddles 33,557, moving versus dead button 19,858, the single-chip call-or-raise 18,726, and rake on split and side pots 18,345** (Poker TDA forum, cash board). The same handful of situations recur on TwoPlusTwo under different titles — "Floor ruling on dealer mucking winning hand after player doesn't show kicker", "Tabled hand

is mucked, hits muck, floor rules it's live??", "2 Boxed cards ruling" (2+2) — and on PokerForum.ca ("Showdown: who is required to show their hand first?", "When is hand technically dead?") (pokerforum.ca).

Lookup questions are a different animal: enormous views, no argument. On Board & Card Games Stack Exchange, "How do you determine the winner of a Texas Hold'em hand?" has 200,299 views, "ante versus blinds" 131,837, heads-up blind structure 83,121, "flush tie or not?" 28,691 and "can a player use only the community cards?" 27,229, against 5,407 for the top strategy question on the tag (Stack Exchange). Search volume tells the same story at larger scale: third-party estimates put "poker rules" at about 165,000 global searches a month and "poker hand rankings" at 90,500, with all series **peaking in December–January** — a holiday home-game pattern, not a WSOP one (RankHero: poker rules; RankHero: poker hand rankings). These figures sit on Google Keyword Planner bucket values and should be read as orders of magnitude only. Google autocomplete, fetched live, says what that searcher wants: "poker rules" completes to simple, hands, for beginners, cheat sheet, sheet, pdf, printable — a one-page sheet for the table, not a mid-hand adjudication (Google autocomplete). Individual procedure phrases ("who shows first poker", "poker kicker rules", "can you check raise", "split pot poker rules") each fill their autocomplete slots, which confirms they are asked, while "misdeal", "string bet" and "side pot" are crowded out after three or four suggestions (Google autocomplete).

Putting the measured engagement, views and recurrence together gives the following ranking. Frequency and engagement are the researchers' synthesis of the sources above, not a survey; no survey, moderator tally or FAQ ranking rules questions exists on any venue searched.

Situation cluster	How often asked	How much argument	Where it lives
Winning hand mucked, dealer-mucked after verbal all-in, "is my hand dead?", who shows first	High	Highest (141, 160, 128, 122-comment threads; TDA 23k views)	Reddit, 2+2, TDA forum
Verbal vs chips, string bet, "I see your bet and raise", single-chip, out-of-turn action	High	Very high (183/69, 136/44, 134/128)	Reddit, PCF, TDA forum
Etiquette with no written rule: slow roll, tanking with the nuts, talking about the hand	High	Very high (286, 140, 113 comments)	Reddit
Hand rankings, kickers, ties, board plays, flush vs straight	Very high in views, rare on forums	Low (lookup)	Stack Exchange, Google
Dealing errors: exposed card, boxed card, extra card, misdeal	Medium; "most common mistake in home games"	Medium–high (381/91, 162/100)	2+2 Home Poker, PCF
Floor got it wrong on a big pot — what are my options?	Medium	High (130/90, 98/97, 76/84)	Reddit
Cash-game mechanics: running it twice, straddles, dead button, side pots, dealer-error payment	Medium	Medium (TDA cash board 18k–61k views)	TDA forum, explainer pages
Home-game governance: who decides, banning a winner, cheating, IOUs	Medium	Medium (79/44, 49/53)	Reddit, PCF

The pattern underneath the heat is worth stating plainly: argument correlates with **ambiguity of fact**, not ambiguity of rule. The TDA standard that cards remain live while "100% identifiable and retrievable" is clear (The Lodge TDA rules); what is contested is whether they were, whether "raise" was said, whether the dealer heard it — and the poster is always a party. Etiquette disputes are the exception: slow rolls are heated precisely because no rulebook settles them, and they are the one category where posters are routinely told they were the one in the wrong.

Home cash games fight over money procedure, which no rulebook covers

The home-game forums that could be read show a different centre of gravity from the casino threads: **money-procedure threads outnumber hand-ruling threads**, and they are host-to-host policy questions rather than player-versus-host disputes. The recurring end-of-night problems are a chip count that does not match recorded buy-ins, an unrecorded or unpaid rebuy, non-payment after a settle-at-the-end game, and awkward change at cash-out. The community's fix for all of them is process rather than adjudication. In the PCF cash-out thread several hosts say the host cashes out last and "is the only one responsible if the bank is short"; one has been short "a dollar or two a few times, never a substantial amount" (PokerChipForum). A host of 100+ games who wrote "split the loss evenly among all players, winners included" into his rules got, as the most common objection, that the organiser should bear shortages and that mentioning theft "seems unfair or suspicious" (PokerChipForum). A banker who lost money when Venmo rebuys never arrived, when he forgot informal "can I get 50 more?" requests, and when he took chips from his own stack, absorbed most of it himself; members' advice was cash only or a running tally, chips only after the payment shows, and the player recounting rebuy chips aloud (PokerChipForum). "Who eats a short bank" is genuinely contested, but the forum norm leans toward the banker owning the error, and a product that defaults to "host absorbs" with an optional split rule would match expectations better than the pro-rata scaling one app vendor proposes (PartyPot).

Numeric parameters are where groups diverge most, and there is no citable default. The one hard engagement figure found in the home-game sections is a **60-vote poll on the maximum rebuy as a share of the largest stack: 28 chose 50%, 10 chose 100%, 3 chose 75% and 19 "other"** — no majority even among enthusiasts, with arguments on both sides about collusion by rebuying upward and the unpleasantness of being down and unable to buy back (PokerChipForum). Notice before leaving ranges from one orbit to one hour; a one-hour rule drew the reply that it is too long for emergencies (PokerChipForum). Going south is uniformly condemned — "in home games you never leave based on your stack" — but **no one described a host formally enforcing it; it is a social norm** (PokerChipForum). Non-payment is treated as a membership problem, never a rules problem: settle before you leave, no IOUs, "anyone who hasn't settled sits out the next game" (Chips of Fury); one host's rules give three days for Venmo and require a non-payer to tell the organiser privately so the group can enforce, exclude or absorb (PokerChipForum); Brunson's column records a weekly game that died over an unpaid $200 loan (poker1.com). Rounding at cash-out is settled by declaring it in advance — most groups round to $1, $5 or $20, with leftover change going to a tip jar or a final flip hand — and the caution that a host who fusses over small change "may not be invited back" (PokerChipForum). In the thread sharing a free web ledger, a member asked how hosts handle totals that do not balance, and **nobody answered** (PokerChipForum).

Robert's Rules helps with some of this and is silent on the rest. Its private-game edition does fix table stakes ("the amount bought must be announced to the table, or only the amount of the minimum buy-in plays"), a full no-limit buy-in of forty big blinds, one short buy per session, add-ons in any quantity between hands, return within an hour at the amount removed, no splitting pots by agreement, and dealing twice when all-in (Robert's Rules, private-game edition). It never uses the phrase "going south", says nothing about notice before leaving, rebuy caps as a share of stacks, IOUs or who covers a short bank, and does not define who the decision-maker is in a private game. Published house-rules templates converge on the same dozen clauses — buy-in range, rebuy cap and timing, no mid-hand buys, no going south, notice before leaving, re-entry at the same amount, no credit or a payment deadline, who absorbs bank errors, run-it-twice cap, chop policy, straddles, and host-as-floor — each written to pre-empt a known argument (HomePokerTourney house rules). Autocomplete confirms hosts search for exactly this: "poker cash game rules" completes to **home poker cash game rules, poker cash game house rules, poker cash game buy in rules** and "are cash poker games illegal" (Google autocomplete) — a legality question that Robert's Rules opens with and that house-fee threads keep returning to (PokerChipForum).

One caveat governs this whole section. Reddit and TwoPlusTwo blocked every fetch, the archive API returned nothing for r/homepoker, and **ledger and settlement disputes did not appear in any measured community thread** — only in PCF host threads and vendor FAQs. Either they are rare on public forums or they live in private group chats; the research cannot tell which.

No app has made a ruling convenient, and none has an audience

The app-store "rules" category is effectively unoccupied rather than crowded. Of thirteen Google Play results for "poker rules", only two are rules references — both the TDA's — and the rest are games and GTO trainers (Google Play). The Official Poker TDA Rules app is a free rulebook reader with keyword search and no Q&A, last updated in December 2024 with "slight grammatical updates", and shows too few ratings to display a score (App Store). The cheat sheets that make up the rest of the category have **3 to 22 ratings each**, and the only substantive content complaint in any of their reviews is "no explanations" — "impossibly hard quiz with no explanations", "no help system" (App Store: Poker Hands Quiz). Nothing found addresses cash-game procedure or home-game house rules; both TDA products are built on a tournament rulebook and designed for iPad.

Home-game tooling split in 2025–26 into two halves, and rules content is absent from both. Pokerrrr 2 is the audience: 4.5 from 29,000 US ratings (App Store) and an estimated 2.3 million installs (AppGoblin). Its tagline is "Your Crew. Your Table. Your Rules.", but its only rule-shaped features are variant toggles, and the complaint that recurs is trust: reviews alleging the app favours the host, an affiliate blacklist

citing "unfair practices" (PokerListings), and an Indie Hackers thread where a group "almost quit Pokerrrr 2 several times due to people not trusting the app" and a developer observed that "custom game rules" are what apps are missing (Indie Hackers). PokerNow encodes house rules as per-table toggles — live straddle, run it twice, bomb pot, 7-2 bounty — and shipped a Session Ledger in August 2026 that sums buy-ins and buy-outs but leaves settlement "up to the group" (PokerNow). The other half is a cohort of near-identical iOS settle-up trackers launched in the last eighteen months — ChipUp (4.99/*month*, * * 1.0*from*2*ratings* * *,*withacrashreview*)([*AppStore*](*https*://*apps.apple.com*/*us*/*app*/*chipup*/*id*6747723921)), *Tilt*(*per−gametickets,noratingsshown*)([*AppStore*](*https*://*apps.apple.com*/*us*/*app*/*id*6761335586)), *PokerSquad*(3.99/month, one rating) (App Store), HG Poker, Pokertally, StackPro, PartyPot — every one of which computes who pays whom, and **not one of which carries a rulebook, a house-rules editor, a ruling tool or a dispute log**. ChipUp's claim that its records "help avoid arguments over missing money" is the only dispute-adjacent sentence in the category, and it is about the ledger, not rulings. The one tool that ships Robert's Rules text is Poker Mavens, a hosted online-poker server, in its documentation (Poker Mavens docs).

Willingness to pay for rules content specifically is weak and indirect. Robert's Rules was once sold and is now free (Pokerology); the TDA's revenue comes from membership and certification, not from the text; the paid rules-adjacent apps cost 0.99–1.99 and have tiny rating counts. The money in home-game apps is charged for running the night — settlement, leaderboards, clubs — at $2–5 a month or per game. The clearest published evidence that disputes are the selling angle for rules content is a book marketed as holding "the answer to every poker argument, standstill, or face-off imaginable" (Everand).

Recommendation: build the ruling feature into the ledger, not a second app

The evidence supports a feature, not a product, and it does so from three directions. First, distribution: a standalone rules app would have to acquire users from a store category nobody searches — the best-maintained rules product in existence has zero displayed ratings months after launch, and the whole category tops out at 22. The large search demand that does exist is for hand rankings and printable beginner sheets, served free by a dozen SEO pages with near-zero CPC on the hand-ranking terms (TheSEOLabs), and there is no evidence that traffic converts to an app (the cheat-sheet apps that chase it have three ratings). Second, inputs: a ruling needs the seated players, the stakes, the house rules and the host, and the ledger already holds all four while no rules app holds any. Third, the moment: on the measured evidence, home cash-game disputes cluster at the end of the night around the bank, the rebuy record, rounding and who owes whom — which is the exact record the ledger app already keeps and the exact point where it already shows a Rounding sheet and a money-rules screen. The steelman for a separate app is that a rules-first product could capture the ~165,000 monthly "poker rules" searches and the December home-game season as a top-of-funnel; but a free printable house-rules sheet generated by

the ledger app, published on the web, captures that funnel without a second product to maintain, and the most recent forum evidence on rules-apps-as-business is a 2013 International Poker Rules Association app that no longer surfaces anywhere (PokerNews).

What differentiated has to mean

Nothing in the market does any of the following, and together they are the feature.

Cash-game and home-game first. Table stakes, going south, rebuy minimums and caps, chips in play, leaving with chips, time away, splitting by agreement, running it twice, straddles, misdeals and exposed cards in a self-dealt dealer's-choice game — none of it is in the TDA rulebook the existing tools use. This alone is unoccupied ground.

House rules as data, set once per group, with cited defaults and honest blanks. Where Robert's Rules speaks — forty big blinds for a full buy-in, one short buy per session, return within an hour at the amount removed, no splitting pots by agreement, dealing twice permitted — pre-fill it and cite it (Robert's Rules, private-game edition). Where it is silent — rebuy cap as a share of stacks, notice before leaving, who absorbs a short bank, the rounding unit, IOU deadline — present the choice as a choice with the forum range (50%/75%/100% of the big stack; one orbit to one hour; host absorbs or split; 1/5/$20), default to the community norm (host absorbs; declare rounding in advance), and never invent a rule. PokerNow proved toggles are the natural shape; nobody has built them for a physical table.

A walkthrough that produces a verdict with the rule and the reasoning. For the fifteen or so situations that drive the argument — the mucked winner, verbal versus chips, the single chip, string bets, the out-of-turn call, who shows first, exposed and extra cards, running it twice, the short all-in reopening the betting, side-pot eligibility — a short decision tree ("Was 'raise' said? Was the chip larger than the bet? Had anyone acted after?") gives a deterministic answer with the rule cited and the facts restated. That answers the "no explanations" complaint and avoids the invented-rule failure the board-game referee bots exist to fix. If an AI layer is added later, it should map the player's description onto that tree rather than free-generate a verdict, and the rules edition and date should sit on every answer — the TDA assistant's drift from 2024 to 2026 is the maintenance failure to design against.

A timestamped ruling attached to the night. The PCF dispute was unresolvable because both hosts were in the hand (PokerChipForum); every hosting guide's one rule is to name a final decision-maker (Advanced Poker Training); Robert's Rules says a pot ruling must be requested before the next deal starts. A ruling record — who asked, the facts as agreed, the rule applied, who decided (with a stand-in when the host is in the hand), who acknowledged, timestamped and closed at the next deal — is what a ledger app uniquely can do, and it is the trust mechanism Pokerrrr 2's reviewers are asking for in another form. The same pattern already works for money in one host's game, where every buy-in notification must be disputed immediately or stands (PokerChipForum).

Money-dispute procedure where the ledger already is. A short-bank checklist at count-up (chips in play should equal buy-ins plus rebuys; audit the rebuys; check the float; search the room) with the group's shortfall rule applied automatically; rebuys acknowledged by the player at the moment of recording; an IOU with a settle-by date and the "sits out until settled" consequence recorded, since exclusion is the community's only enforcement. These are extensions of the ledger's existing rows, not a new vocabulary.

Offline, no ads, and a printable sheet. Rulings happen at a kitchen table, and the cheat-sheet apps advertise offline for that reason (App Store: Poker Hands - Cheat Sheet). A one-page house-rules sheet generated from the group's settings — "we use these rules; the host decides anything not on this page" — matches the advice hosts already follow (HomePokerTourney house rules), matches the printable/pdf intent behind the search demand, and is the feature's own distribution channel when shared to a group chat before the night.

Write the rules text in-house. Robert's Rules cannot be reproduced commercially without consent that can no longer be obtained; restating its provisions in original wording with attribution is both the legal path and what makes them customisable.

Sequence and what remains unproven

The cheapest first step is the one closest to the app's existing domain: the house-rules settings with cited defaults, the shortfall and rounding rules applied at count-up, and the printable sheet — none of which needs rulebook content beyond a few restated lines. The hand-ruling walkthrough for the top ten to fifteen situations follows, and a grounded assistant is optional and last. Three things the research could not establish should be checked before committing to the second step: how often a real group opens a ruling at the table (instrument the feature and watch), whether r/homepoker's unmeasured traffic changes the ranking of situations, and whether anyone will pay for rules content at all — the honest reading is that the feature earns retention and differentiation for the paid tier rather than revenue of its own.

Conclusion

The market has settled into a shape that nobody intended: the rules of a home cash game are kept by a dead author's PDF, interpreted by a forum consensus or a famous director's Twitter replies, and enforced by whoever is hosting — while a dozen new apps compete to compute the same minimum-transfer settlement and not one of them records what the group agreed to. That gap is not a product category waiting for a standalone entrant; it is a missing layer in the thing hosts already use, and the reason it is missing is that only a ledger knows who was at the table, for how much, and under whose authority.

What changes with this understanding is the definition of a "ruling". The casino model — a floor arrives, consults a rulebook, decides — is the wrong template for a kitchen table where the floor is in the hand.

The useful artefact is not the verdict but the record: the house rule declared before the night, the facts agreed at the time, the decision and who acknowledged it, closed before the next deal. Build that into the ledger and the app stops being a calculator the losers have to trust and becomes the thing the group points at when the argument starts.
